FOREWORD

The Ministry of Agriculture and Forests is pleased to bring out the Bhutan RNR Statistics 2021. It is a comprehensive and systematic compendium of the relevant statistics in the domain of Renewable Natural Resources (RNR).

The BRNRS21 is expected to serve as the major source of information for planners, policymakers, researchers, and academicians. The statistics presented are compiled based on the information gathered through the statistical surveys and censuses as well as from the administrative data maintained by different agencies and departments under the Ministry of Agriculture and Forest (MoAF).

The statistics are thoroughly harmonized and validated by the Policy and Planning Division and also by the RNR-Technical Working Group (RNR-TWG). As statistics are compiled from various sources, each statistical table mentions the source so that data contributors are duly acknowledged and secondary users may contact the source for any further information.

I would like to extend my appreciation to the Agriculture Statistics Division (NSB) and all departments/agencies including the dzongkhag RNR sectors for their contribution and for successfully bringing out this publication. To improve the quality of the statistical issues, we would like to request comments and suggestions from the users of this publication.

This publication will be the official source of information on the RNR sector and the electronic version of the publication will be made available at www.moaf.gov.bt.

CHAPTER 1: PRODUCTION

This chapter presents summary statistics on the harvested area of primary crops, production of crops & dairy products along with the livestock population at the national level. The crop and livestock statistics are based on the agriculture and livestock statistics 2021 conducted by the Agriculture Statistics Division (ASD) under National Statistics Bureau (NSB).

Agriculture farming had remained one of the mainstays of the Bhutanese population depending on agriculture for livelihood. Bhutanese Agriculture Sector has come a long way since the introduction of modern agriculture techniques in first Five Year Plan, gradually transitioning to commercial production from that of subsistence systems.

With an average farm size of 2.22 acres (PHCB, 2017), most farmers practice subsistence to semi-subsistence integrated farming systems. Despite its small size, Bhutan's agroecology is diverse with large variations in altitude and micro climatic conditions.

The livestock-keeping households are enumerated on a complete basis, the statistics given are actual totals and not based on estimates. Another important difference from the crop statistics is that the livestock statistical figures include live animal numbers and production from the government farms as well and hence reflect a complete picture of livestock population and production within the country.

Table 1.1.1 HARVESTED AREA UNDER CEREALS (2017-2021)

Crops	(Value in Acres)				
	2017*	2018**	2019*	2020*	2021

Wheat	3,883	1,445	1,319	1,623	1169

Source: *Annual Agriculture Statistics & **RNR Census 2019, MoAF. Agriculture Statistics 2021, NSB

The major cereal crops grown in the country are paddy and maize. Other cereals include wheat, barley, buckwheat, Millet, Amaranthus, and Quinoa. The domestic paddy harvested area decreased by 23% and production by 25% in 2021 as compared to that of 2020. The Maize harvested area decreased by 27% and production by 25% in 2021. Likewise, there is slight fluctuation in all other crops like vegetables, roots & tuber and fruits etc....

In general, the main reason for crop reduction are: -

1. Due to natural calamities (heavy rainfall during the harvest seasons, hailstorm, frost & wind)
2. Direct and indirect crop damaged by pests (Insects, birds & rodents)
3. Due to heavy pruning and die back of the fruit tree
4. New variety less yield
5. lack of fertilizers and irrigation

CHAPTER 2: TRADE

This chapter presents the statistical tables on year-wise import and export of RNR commodities from 2017 to 2021, as per the Bhutan Trade Statistics compiled by the Department of Revenue and Customs (DRC), Ministry of Finance. The import of types of farm machinery, fertilizers and plant protection chemicals are presented separately.

The data on trade is useful for calculating trade balance, food balance sheet, food security, and many other indicators. It can also yield useful information with regard to trends in people's consumption patterns, the country's production capacity, and pointers for policymakers in relation to investment in agriculture and related industries.

Table 2.1 EXPORT OF MAJOR FOOD ITEM FROM INDIA AND COTI (2017-2021)

CHAPTER 3: LAND USE AND LABOUR POPULATION IN AGRICULTURE

The primary source of data on agriculture farm labour is the labour force survey, which is conducted by the National Statistics Bureau (NSB) annually, and captures the total farm labour on both the male and female in agriculture sector.

Land is one of the most important elements in agriculture and hence statistics on land and its use is of special interest to the users. Although the figures may be outdated by now, nonetheless owing to lack of any recent land cover mapping efforts, we present in this chapter the figures from LCMP, 2010 and National Forest Inventory (NFI), 2016. Additional statistics on government land leasing and private individuals' land conversion, mainly from wetland to dryland category, are also presented.

Therefore, in this chapter it includes the statistics on agricultural land area and farming labour involved by the both genders.

CHAPTER 4: MACHINERY

Mechanization of Bhutanese farming has been given importance since the 1980s and continues to this day. With the trend in young and able-bodied people seemingly leaving the rural farms in search of jobs in towns, the farms in the countryside face labour shortages and wages have steadily increased, driving the whole production prices up. Farm mechanization is therefore seen as one area that requires major focus.

The major importer of farm machinery has been Agriculture Machinery Centre (AMC) under the MoAF. However, in recent years, a number of private bodies have also entered the scene and play an important role in mechanizing Bhutanese farms. Further, the government in a drive to speed up farm mechanization process has created Farm Machinery Corporation Limited (FMCL), a state-owned enterprise. The job of importing, distributing, hiring and providing maintenance services which has until recently been carried out by AMC will now be looked after by FMCL.

This chapter presents the statistics on number of different farm machineries imported, owned by government agencies and also owned by private individuals for farming purposes in a households.

CHAPTER 5: AGRICULTURAL INPUT SUPPLY

Since the inception of the 1st FYP, the ministry has been providing the agriculture inputs such as agrochemicals, seed & seedlings, and green house to all the farming communities in the country to promote the national food sufficiency and security.

The demand of seeds and seedlings were mostly produced in the farms of National Seed Centre and the deficit were produced by the Registered Seed Growers who were the collaborators of NSC. The farmers often depend on agrochemicals (pesticides and fertilizers) to combat pests and diseases, boost productivity, and improve crop quality.

Bhutan may not become totally organic, at least in the near future, but certainly the country is aware of the harmful effects of agrochemical pesticides and therefore strict measures are put in place to control the import and use. No private players are allowed to import agrochemicals due to fear that all kinds of dangerous and/or inferior quality

chemicals may be imported. Only National Plant Protection Centre (NPPC), an agency under Department of Agriculture, MoAF, is mandated to oversee the import and its distribution. From the statistics over the years, one will notice a gradual increase in

the quantity of agrochemicals imported and distributed.

This chapter first presents the statistics on import quantity and value of agrochemical imported from 2017 to 2021 based on the data maintained by Bhutan Trade Statistics. It gives an idea of the trend in agrochemical usage. Then we present data on agrochemical distribution by National See Centre and National Plant Protection Centre. One difference between the two sources is that BTS data is by calendar year basis (Jan – Dec) while NPPC&NSC data is by financial year basis (Jul – Jun).

CHAPTER 6: INFRASTRUCTURE

This chapter presents statistics on the state of various production infrastructures such as offices, irrigation canals, farm roads, and electric fencing across the country. These kinds of hardware inputs are crucial in keeping rural farms up and running, combating rural-urban migration and ensuring food self-sufficiency or food security.

The construction of irrigation canals and farm roads is often executed by both central bodies in Thimphu (e.g. by the engineering division of DoA) and the Dzongkhags themselves through funding from various sources, hence compilation of statistics accurately and timely on these infrastructures is quite challenging.

Electric fencing, which has become quite popular as a means to keep wild animals off crops is another input that is executed by several bodies such as NPPC under DoA, various functionaries under DoFPS, various projects, and even NGOs. Private individuals are also known to put electric fencing around their fields. Nonetheless, we present here reliable and updated figures to the best extent possible.

CHAPTER 7: PRICE

Price received by farmers for their produce is an important indicator and therefore this chapter is devoted to price statistics. Price received by farmers means the farm-gate price. The annual agriculture sample survey collects price of products sold by farmers and is a good source. However, for livestock products like milk, meat, eggs and so on, farm gate price data are not available as the annual livestock census does not collect this indicator. Another source of price received by farmers is the auction price of commodities available from FCBL. Auction price is however not farm-gate price as farmers have to bear transportation cost from the villages to the border towns.

Prices for locally produced commodities sold at the Farmers' Centennial Market in Thimphu, collected regularly by DAMC, are also presented to give an idea of the retail prices, which are often several times higher than the prices received by farmers. Price of the imported commodities is also presented and gives further insight into the differential prices occurring.

This chapter also presents price of the various inputs such as seeds, seedling and fertilizers supplied by National Seed Centre. The price charged by NSC are at subsidized rate.

CHAPTER 8: FORESTRY

Although users of the RNR sector data are used to seeing forestry statistics just adjacent to crop and livestock, here we present forestry statistics very much separately, almost at the end of this document. The statistics presented are non-wood forest products quantity extracted from the forests for use by the people and royalty charged; extraction of timber, stones, leaf litter, sand and so on. The data are compiled from the administrative records maintained by the various Territorial Forest Divisions, National Park offices and also the state-owned Natural Resources Development Corporation Ltd (NRDCL). The later extracts timber from the Forest Management Units and sells to the saw-mills from where clients finally buy. It also extracts and sells sand and boulders from the designated river banks and sites.

One of the biggest threats to the forest wealth of the country is the forest fires which are mostly caused by humans either through negligence or deliberate means. Forests destroyed by fires are truly a loss as no one benefits financially and is also a major contributor to global warming. At least forest products lost as a result of illegal felling benefits someone. Statistics on forest fire incidences and acreage lost are presented.

CHAPTER 9: METEOROLOGY STATISTICS

For agriculture, water is one of the most important natural resources. The main source of water is rainfall which keeps the rivers flowing, lakes filled, and mountains peaks snow-covered or directly supplies moisture to the crops.

This chapter presents data on total precipitation (in millimeters) at 20 weather stations which are set up and managed by National Centre for Hydrology and Meteorology across the country.

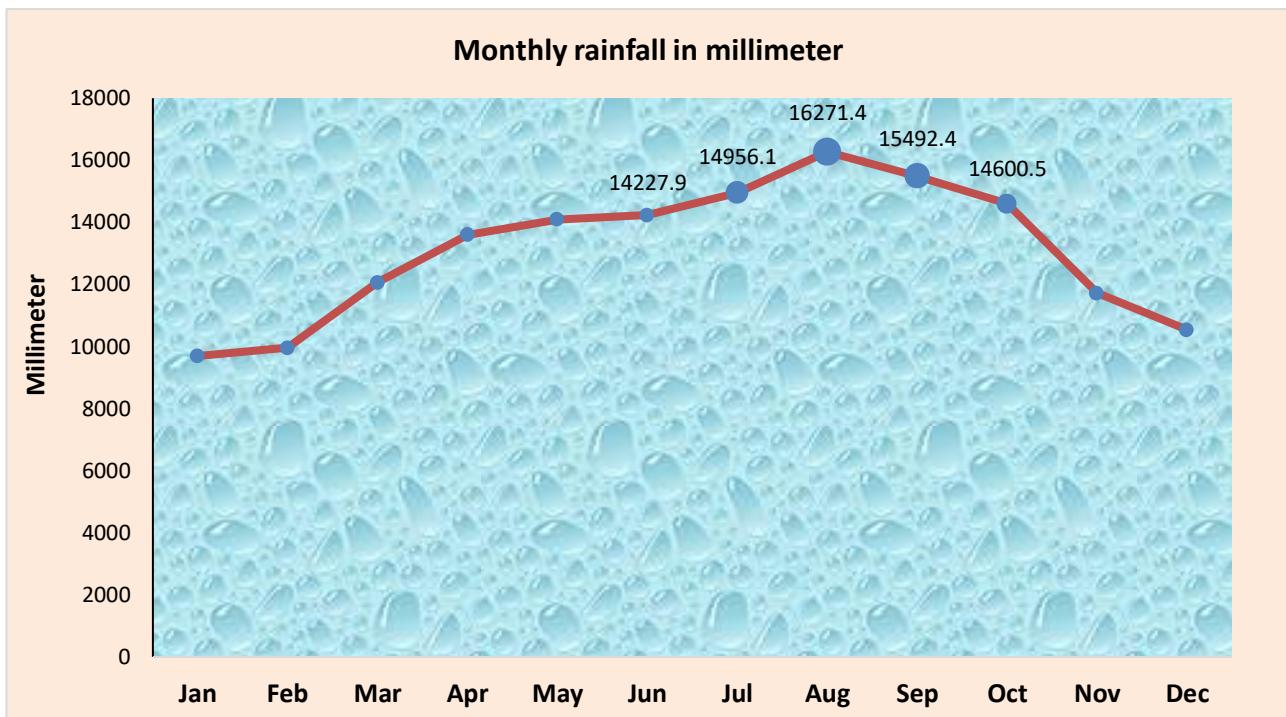

Figure 17: Annual monthly rainfall ,2021

Table 9.1 STATION-WISE ANNUAL RAINFALL (mm) DURING 2021

Station	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
